Screens:

I. Welcome / Splash Screen

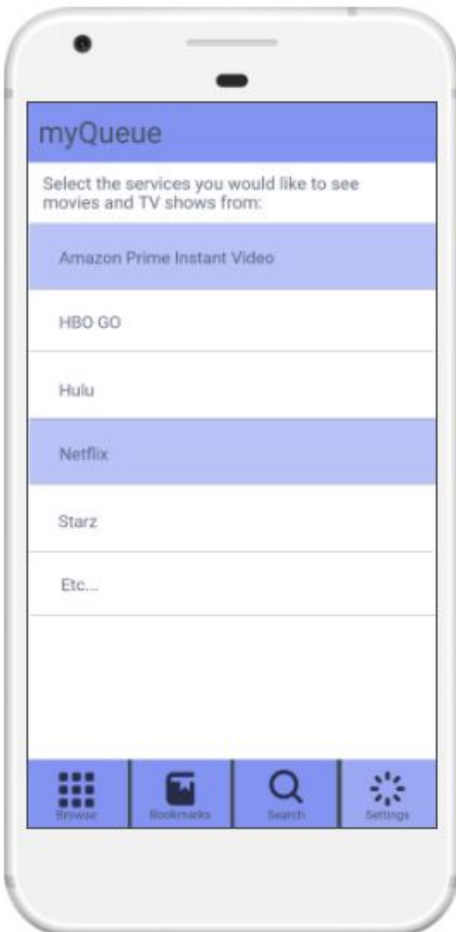

When the Splash Screen is started, a welcome screen will show up to welcome the user. The screen will not be a permanent screen, it will only be there for the first time to greet the user.

User taps anywhere in the screen

-> Navigate to Choose a Service Screen

II. Choose a Service Screen

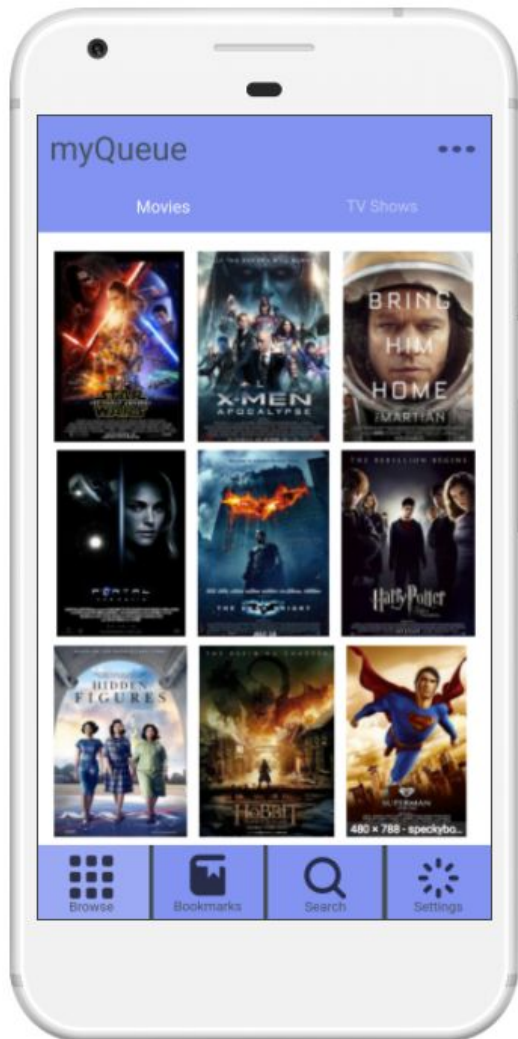

Choose a service screen will show up only when the user opens the app for the first time as well. The user will be prompted to choose between different services like Netflix, Hulu and HBO Go to choose from. The user will be able to select the multiple services.

User selects service(s), clicks next

-> Will populate a list of movies/series of the services that the user have selected.

III. Home Screen

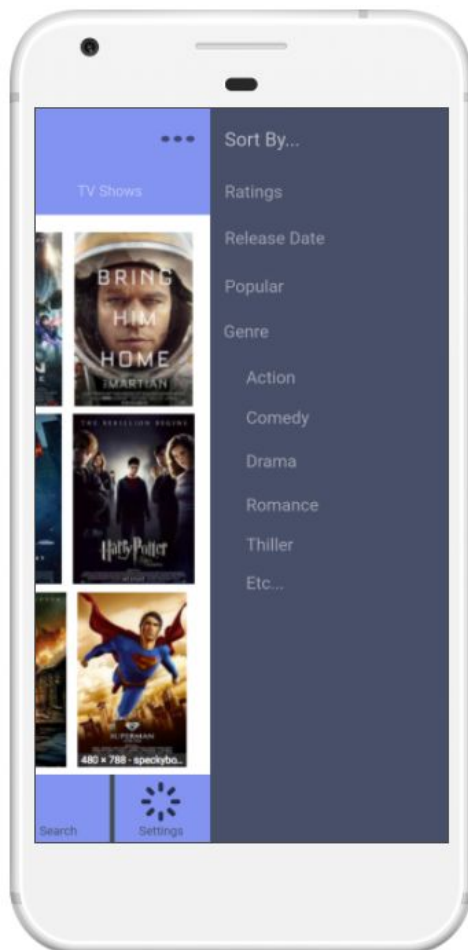

A randomly generated list of movies and or TV shows will be visible. The user will be able to scroll down to view more movies or TV shows depending on their selection. Switching between Movie and TV show views is done by swiping the screen to the right or left. Furthermore, there is a tap bar in the bottom with the following functionalities presented as buttons: Search, Browse, Bookmarks and Settings. And a hamburger menu on the top right corner.

User clicks on the hamburger menu

-> Opens up sort screen where one can sort the movies/series

IV. Sort By Screen

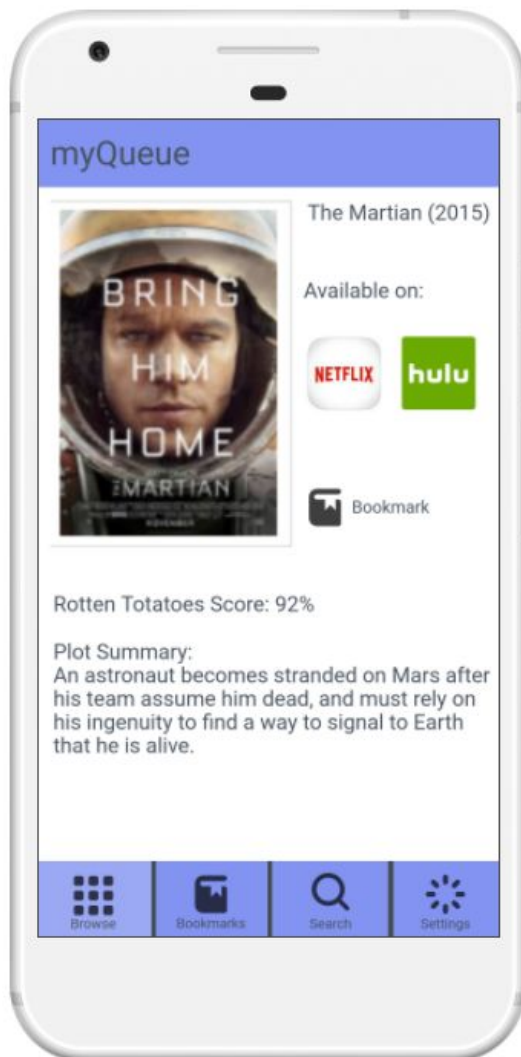

A hamburger screen opens up which has options for sorting the list of either movies or TV shows. The user will be able to sort them by Name, Release Date, Ratings and Genre.

Once the movies/TV shows are sorted, the user can click on a particular movie/TV show

-> Opens up a movie description screen

V. Selected Movie/TV show Description

Movie/TV show description screen will have a poster of the movie/TV show covering a quarter of the screen. Next to it will be the title paired with the release date. And an available on option with the services which the user is subscribed to that offer it. And a button to bookmark that particular movie/TV show. Beneath the poster will be the rating on Rotten Tomatoes and a plot summary.

The user can use the back button to get return to the home screen

-> Opens up the home screen

VI. Search Screen

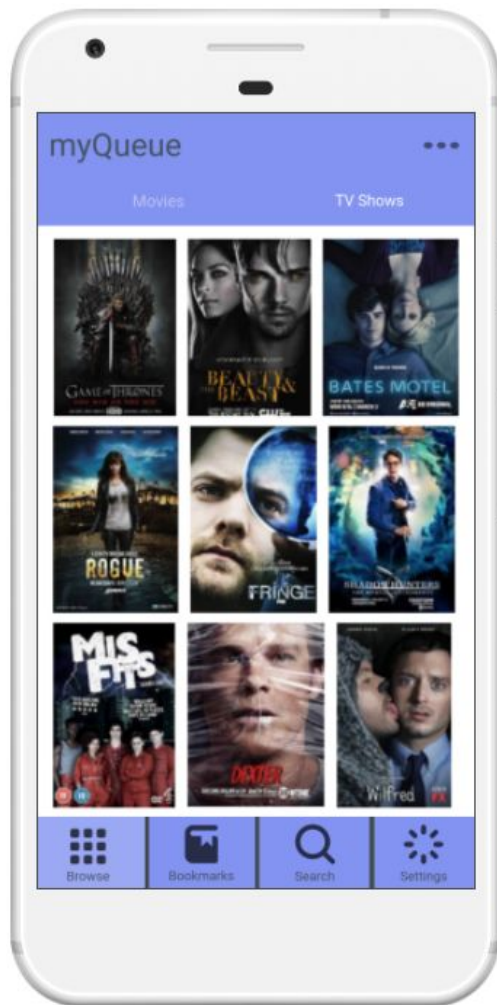

By clicking the search option on the app bar from anywhere in the app, the user can search for a specific movie/TV show that they are interested in.

Click on the Search option on tap bar

-> Opens a search view screen where the user can search for movies/TV shows by their title

VII. Browse Screen

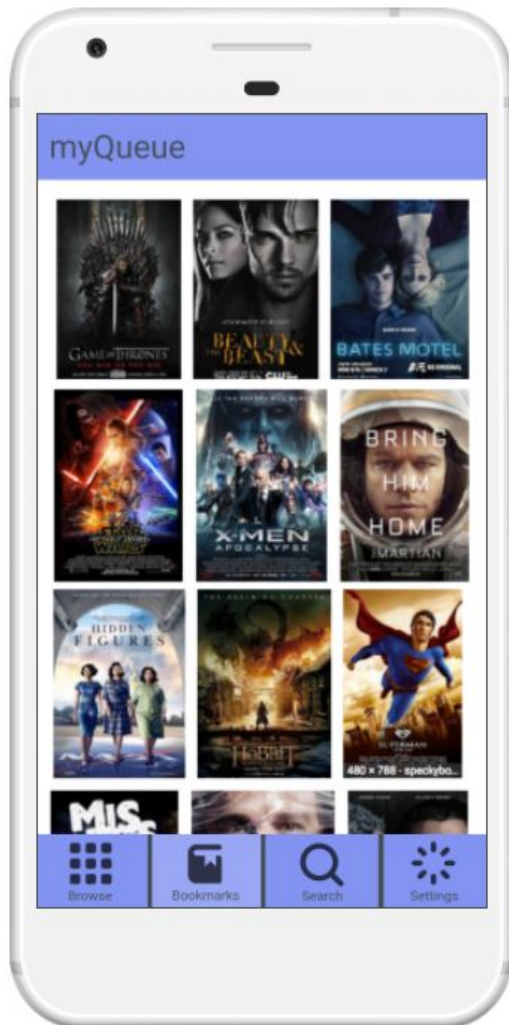

The user can always return to the main screen (home screen) by clicking on the browse option on the tap bar.

Click on the browse option

-> Opens up the home screen

VIII. Bookmarks Screen

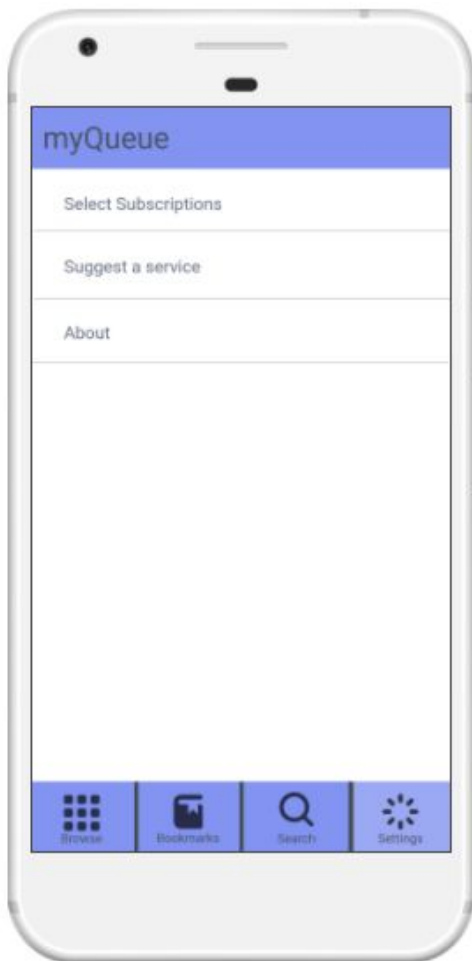

The user can click on the bookmarks screen to show the list of movies/TV shows that they had already bookmarked.

Click on the bookmark option on the tap bar

-> Opens up the bookmark screen

IX. Settings Screen

On the settings screen there is an option to change the services that the user is subscribed to. Another one is to suggest a service for the devs to be included. And an option that provides information about the app, the awesome developers and the APIs used to develop the app.

Click on the Settings option on the tap bar

-> Opens up the settings screen

Alpha Version

The aim for the alpha version is to create a solid user interface that is reliable and usable. The default view which is the browse screen, should be fully functioning.

- Pulling data from APIs should work smoothly.
- The Browse page should work, be able to browse the Movies section.
- Have all posters and images display correctly.
- To have at least one service (such as netflix) work properly.

Beta Version

The beta should fully implement the search functions and the ability to switch between movies and TV.

- Implement the TV series section besides the Movies section.
- Correctly display all movie posters and or images.
- Sorting by release date and name
- Implement other services like HBO go, Hulu, Amazon

Future Releases

More customization and beautification of the App. Also would like to include as many major movie/TV show providers as possible.

- Implement Social Media connections (through Facebook, Twitter, ...), being able to share a movie/tv show through them.
- Ability to search for movies in the theater and pull up TV show playing time on TV.
- Sort by category, Rotten Tomatoes rating.
- Implement information from Box office mojo (movie/TV show budget, earnings, salaries,)
- Search by year, director, lead actor

Use Cases

- The user has multiple movie subscriptions and wants to find a movie/TV show to watch that night.
- A group of friends all have different media services want to look at all of their options at once to decide what they will watch.
- User has multiple media subscriptions and is watching several shows on each. Will be able to use the app to bookmark the TV shows they are currently watching so they do not get behind on any.
- User has multiple movie subscriptions and has heard their friends talking about a TV show/movie. They search for it and if it is available to They are able to bookmark it for later for a later viewing.
